

I am writing this in reference to subject Docket 04-37 and 03-104, regarding Access BPL. BPL has already been banned throughout the world in most important commercial centers of the world. Here in the USA, we appear to know better. Usually we in the USA have to learn the hard way. Unfortunately by that time a lot of people often get hurt. When ever our industry feels something is good for them, its damn the torpedoes and full speed ahead, ignoring the pitfalls. Our governments job is to protect "all" the people. I am certain now that we, the electricity rate payers, are already subsidizing this massive experiment by the FCC and the various communications business that will stand to profit by BPL. I am also certain that the FCC will impose little or no regulation or restraint on this budding industry, and will leave it up to the rest of the country to cope with the interference problems BPL will create. Suggesting to the FCC of ways around the potential problems they already expect, is an exercise in futility. However I already feel sorry for the interference and stress that Amateur Radio stations will create with our next door neighbors computers who will use BPL to get online. I have read the ET Dockets and the arguments, and i have only this to say to the FCC....., if BPL destroys the Amateur Radio Community, after more than 50 years of faithful service, you can be sure you will hear from us all at the voting booth.
